DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1-2 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The method steps are unclear, since there are no indications of specific steps.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-4, 6-9 are rejected under 35 U.S.C. 102(b) as being anticipated by Weyer et al (US 6,386,268).

As to claim 1, Weyer et al disclose the method for adjusting the roller segments comprising the steps of adjusting rollers (3) relative to each other by both position control and

Art Unit: 1725

pressure control. The rollers (3) are adjusted from position control to pressure control when the hydraulic pressure in the piston-cylinder unit reaches a predetermined value (abstract).

As to claims 2 and 4, driven roller (the last roller of the set of rollers 3) are arranged on the segment exit side.

As to claim 3, a containment roll stand is arranged after the bending-straightening unit, having hydraulics piston-cylinder assembly with position and pressure controlled devices (figures).

As to claim 6, the control systems are capable of calculating the adjustment of the hydraulics and automatically control the hydraulics.

As to claims 7 and 8, the control system are capable of controlling the hydraulics by calculating roll spring compensation, min/maximum force regulator, positioning, torque, and speed.

As to claim 9, Weyer et al teaches both pressure and position sensors (figures).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 1725

6. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

7. Claims 6 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Weyer et al (US '268).

Weyer et al fail to teach the drive motor for a driven motor is arranged, together with a transfer case, on one side of the segment frame with a vertical drive shaft orientation.

However, it would have been obvious to an ordinary skill in the art to arrange the drive motor together with the transfer case on one side of the frame, since this would depend on the design expediency.

As to claim 10, Weyer et al fail to teach the drive motor for the driven motor communicates with the basic automation system.

However, it would have been obvious to connect the drive motor to the automation system, since the entire device is driven automatically.
